

PL414 Infrastructure Planning

This course deals with a number of key topics related to planning, financing and management of infrastructure services, in addition to other issues associated with supply and demand. Infrastructure systems include a wide range of utilities, like water services, sewage, drainage of storm water, waste disposal facilities, electric power, telecommunications, etc. These infrastructure sectors will outline the course framework. The course will address experiences of infrastructure provision in other countries and will introduce students to the knowledge regarding the effect of good quality services on the urban and environmental context. It will identify the role of controls, regulations and user participation in the quest to develop these vital sectors.
